

One of the great new benefits of the IDL Workbench is that you can download updates to IDL directly through the workbench at any time. You can download new community submitted IDL code contrib. items or access official patches and enhancements released by ITTVIS.

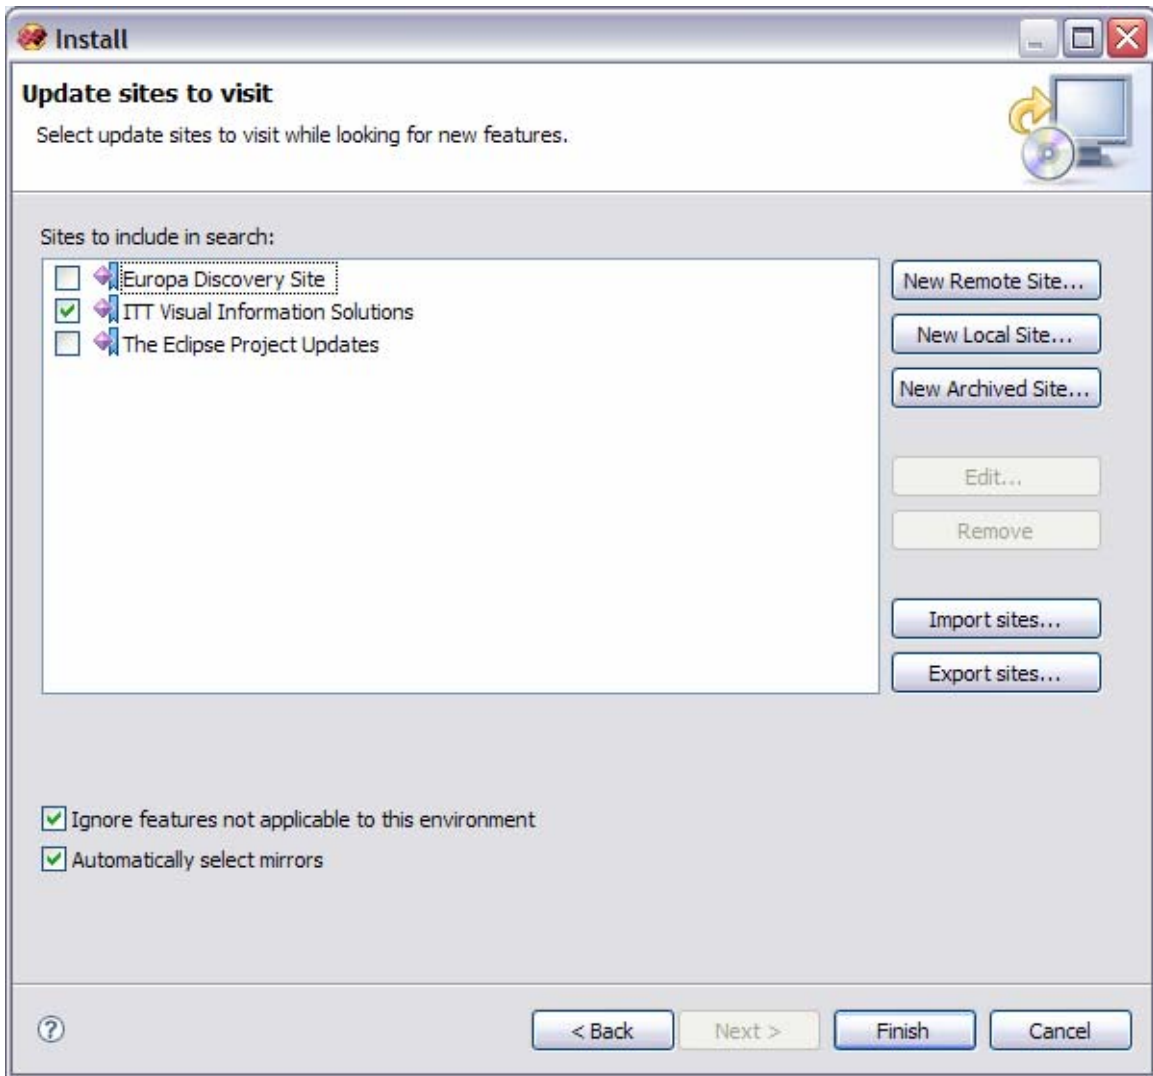

To access updates, select the “Help -> Software Updates -> Find and Install...” option shown below

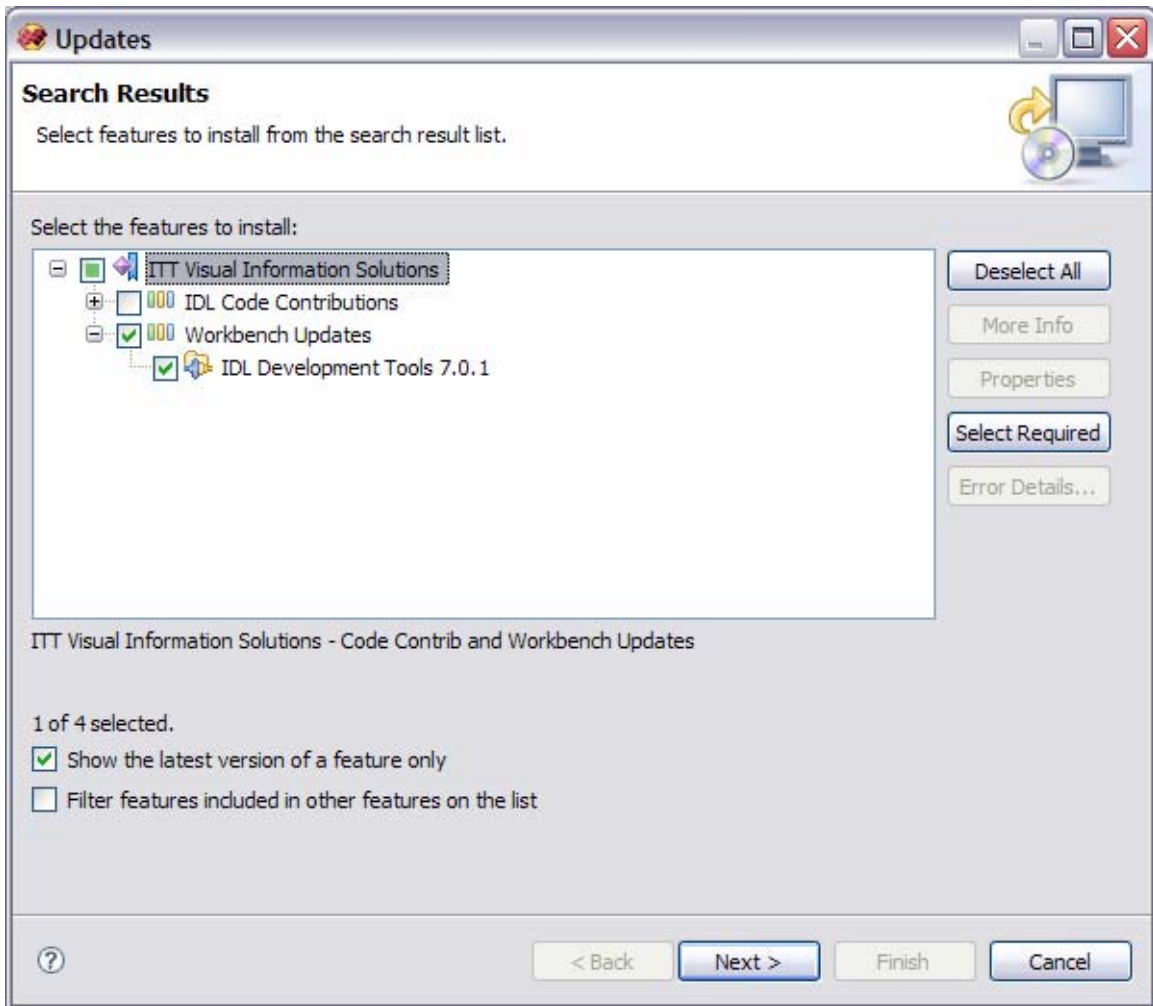

This will bring up the following dialog. At this screen, select the “Search for new features to install” option to select for currently available updates to the IDL Workbench.

Selecting this option will bring up the following dialog, from which you should select the “ITT Visual Information Solutions” option. This will take you directly to the ITT Visual Information solutions server which will have a list of available updates for you to choose from. You may use the default settings for everything else.

This will bring up a final screen which will allow you to choose the specific updates that you want to download and install. For example, selecting the IDL Development Tools 7.0.1 update will give you enhancements made to the parser that will speed up the launch time of IDL.

Check back regularly for the latest IDL updates or new user contributed code examples!
